

Active Warehouse

Proof of Concept in a W2K / WinXP Environment

DI Robert M. Bruckner

May 2002

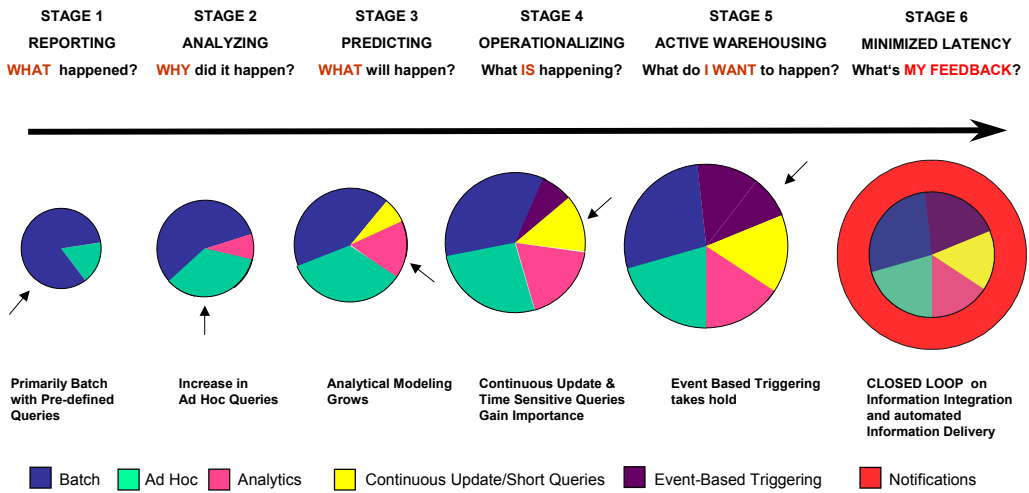

Agenda

- ▶ Active Warehouse
- ▶ Scientific Viewpoint: Minimized Latency in Data Warehouses
- ▶ Need for Messaging Infrastructure

- ▶ Active Warehouse: Architecture Overview
- ▶ Setting up MSMQ
- ▶ MSMQ in a W2K / WinXP Environment
- ▶ High-Performance Data Feeds for MSMQ
- ▶ TPump Job-Scheduling
- ▶ Demo

- ▶ Conclusion

What is an Active Data Warehouse?

► Traditional Data Warehousing

- Focus on “ivory tower” decision makers
- Long-term decision making
- Strategic focus

► Active Data Warehousing

- Expand scope to include “in the field” decision makers
- Day-to-day (minute-to-minute) decision making
- Tactical focus with strategic implications

Business needs both strategic and tactical decision support capabilities.

- ▶ **Decrease the time** it takes to make the business decisions
- ▶ Minimize latency between the **cause and effect** of a business decision
- ▶ Notify the business of actionable **recommendations**
- ▶ Effectively **close the gap** between business intelligence systems and business processes

Analytical decisions integrated into operational processes combined with closed loop analytics.

- ▶ Support for various data freshness requirements
 - Minimize propagation delays for particular data
- ▶ Continuous data integration
 - Near real-time capturing and loading of data
- ▶ Timeliness of data / late-arriving data
 - Represent the history as accurately as possible
 - Deal with late-arriving data in tactical decision support
- ▶ Active decision engine
 - Notifications, event / subscriber paradigm
- ▶ High availability, scalability, and performance

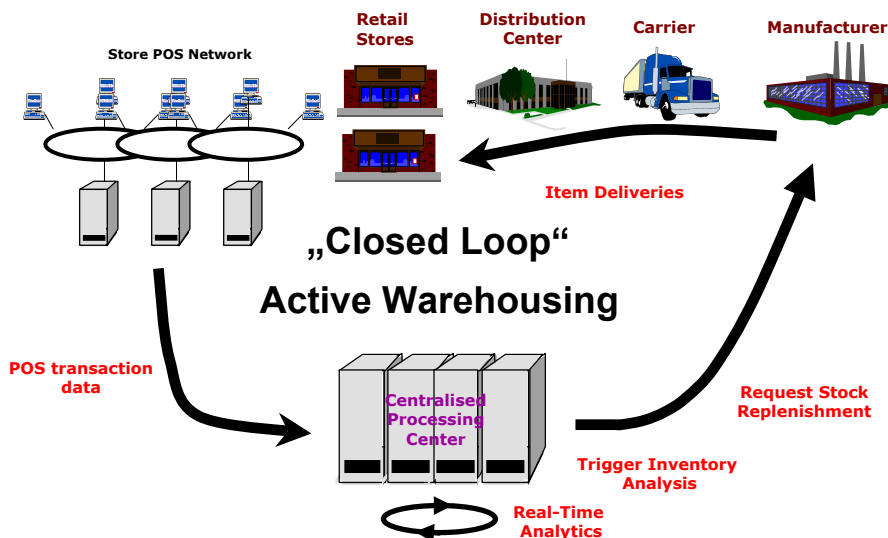

- ▶ A DWH is an enterprise system
 - requiring data from transactional systems
 - delivering data (decisions) to enterprise applications
- ▶ Need for a various levels of Enterprise Application Integration (EAI)

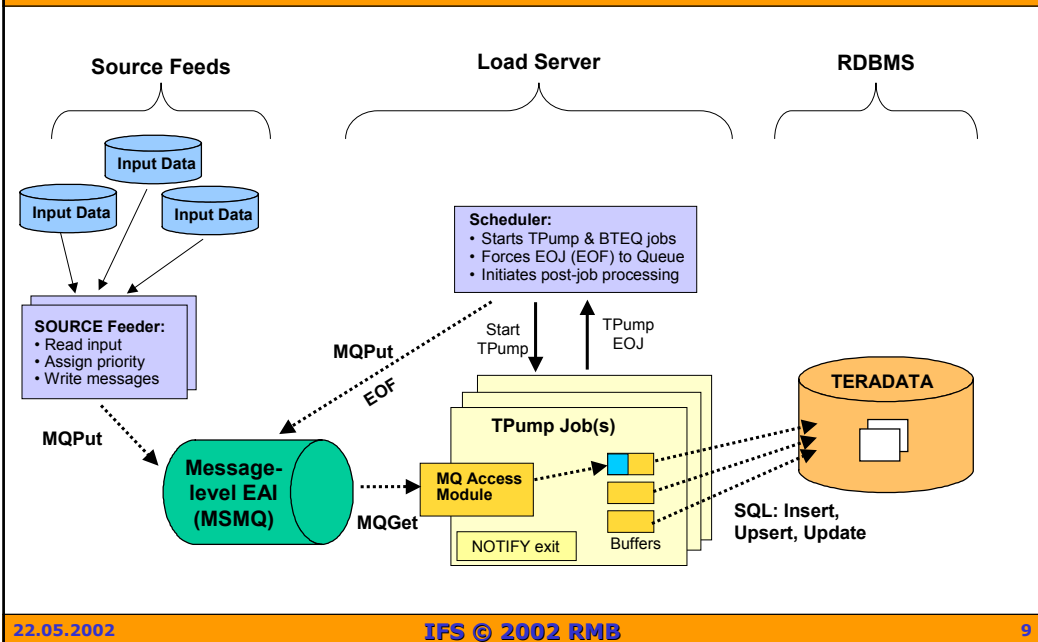

Continuous data integration → message-level EAI:

- ▶ Asynchronous, connectionless service (vs. RPC or socket-based communication)
- ▶ Reliable delivery, transaction support if required
- ▶ Priority-based messaging
- ▶ Decoupling from transactional systems
 - supporting dynamic data rates

Common options: IBM MQSeries®, Microsoft MQ

Active Warehouse: Application Scenario

MSMQ Features

- ▶ Integrated with
 - WinNT4: MSMQ 1.0
 - Win2K: MSMQ 2.0
 - WinXP: MSMQ 3.0
- ▶ Security, message persistence, transaction support
- ▶ **Public Queues** published through directory service
 - Win2K / MSMQ 2.0: Active Directory at domain controller
 - Win NT 4 / MSMQ 1.0: SQL Server 6.5
- ▶ **Private Queues** are not published
 - no directory service overhead
- ▶ More Details: <http://www.microsoft.com/msmq>

- ▶ Re-install MS DTC (Distributed Transaction Controller)
 - run: `\winnt\system32\dtcsetup.exe`

- ▶ Install MSMQ
 - Settings → Control Panel → Add/Remove Programs
 - Add/Remove Windows Components
 - Install Message Queuing Services

- ▶ Optional: Configure MSMQ for **Workgroup Mode**

- ▶ Create message queues using the management console snap-in (run: `compmgmt.msc /s`)

Workgroup Mode:

- ▶ Running MSMQ on Win2K/WinXP within a Windows domain but **not** on the domain controller
- ▶ Enables only private queues on the local machine
- ▶ No directory service overhead

Enable Workgroup Mode:

- ▶ Modify Windows registry
 - HKLM \ Software \ Microsoft \ MSMQ \ Parameters \ setup
 - Add DWord "AlwaysWithoutDS" = 1

- ▶ Event ID 2124: Message Queuing was unable to join the local Windows 2000 domain.
- ▶ Event ID 2121: Unable to complete Message Queuing Setup.
- ▶ Hresult: c00e0075h

→ Re-install MS DTC

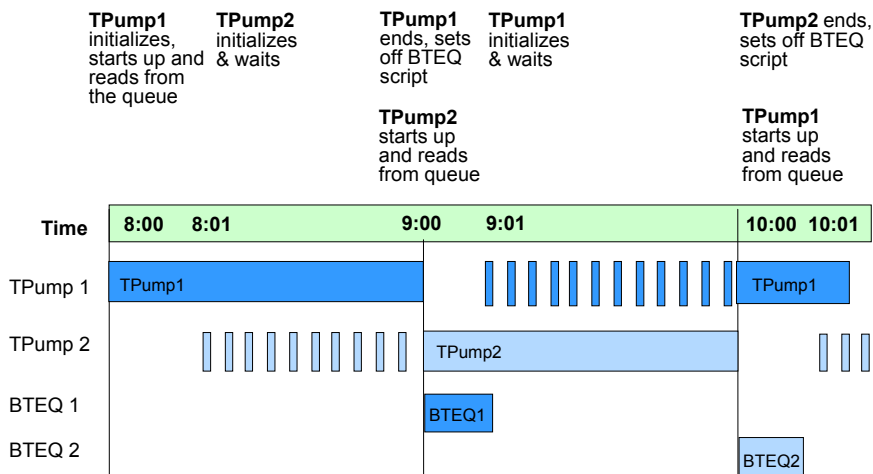

→ Configure MSMQ in Workgroup Mode

- ▶ Provide application data feeds
- ▶ Read transaction messages from a file
- ▶ Add a timestamp to the message
- ▶ Put message into the queue
- ▶ Arrival rate is adjustable

- ▶ Continuous feed
 - New or changed data
 - MPP Teradata loading
 - Many client platforms and sources (AXS-modules)
- ▶ Row level locking
 - Several TPump jobs can run against the same table at the same time from sources varied as Windows, MVS, or Unix
- ▶ Concurrent query access possible

- ▶ TPump is suitable, when some of the data needs to be updated closer to the time the event or the transaction took place

TPump Job-Scheduling

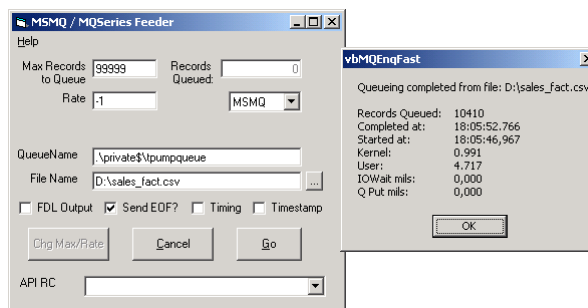

Loading additional POS data into a fact table

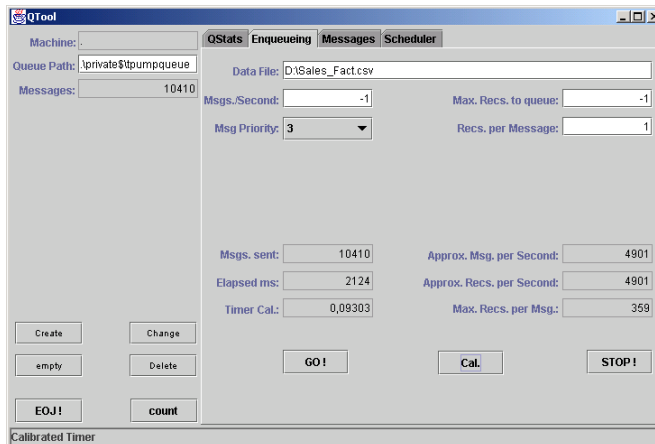

- ▶ Environment: Win2K / WinXP
- ▶ Teradata V2R4.x and Teradata Demo 4.x
- ▶ Source Feeder
 - Source Feeder by Teradata CoE
 - Java Source Feeder and Queue Administration Tool for MSMQ by IFS
- ▶ MSMQ Management
- ▶ TPump Job Scheduler

Demo: Source Feeder by Teradata CoE

- ▶ Feeding into MSMQ or MQSeries queues from files
- ▶ Further information: vincent.hager@austria.ncr.com

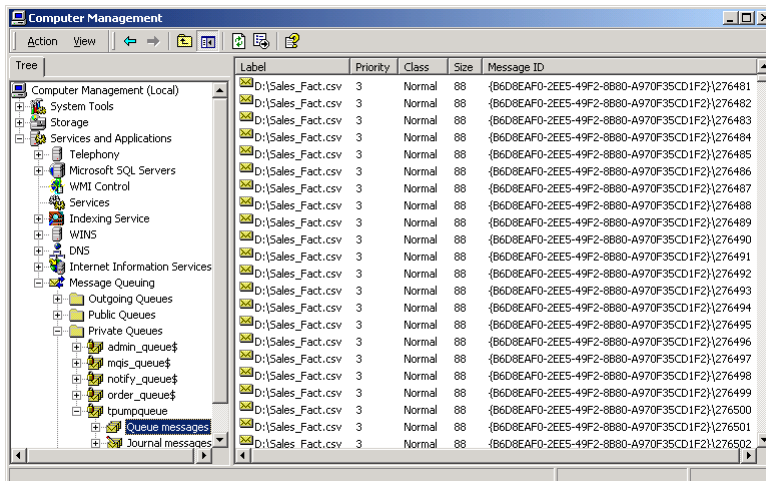

- ▶ QTool 2.0: Source Feeder, MSMQ Admin Tool, Scheduler
- ▶ About **3 times faster** than Source Feeder of Teradata CoE
- ▶ Further Information: <http://www.ifs.tuwien.ac.at/~bruckner/teradata>

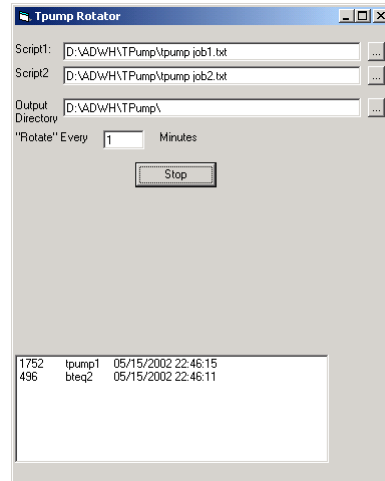

Demo: MSMQ Management

- ▶ Management Console Snap-In, run: `compmgmt.msc /s`

Basic scheduler:

- ▶ Start TPump job
- ▶ End TPump job by placing an EOF message to the queue
- ▶ Launch post-job processing:
 - BTEQ script to consolidate error rows inside Teradata
- ▶ Monitor load process status/results

Future Work

- ▶ Analyze best practices for various data integration scenarios
- ▶ Sample data generation (BeDaWa) engine integration with JMS data feeder to simulate various scenarios for concurrent data update and user load (pattern analysis based on sample data)
- ▶ Vision: minimized latency data warehousing
 - service levels for particular source data
 - near real-time data integration
 - systematic temporal support
 - active information delivery based on notifications

Near real-time data integration works!

- ▶ Carefully analyze your requirements
- ▶ Teradata provides powerful integrated load utilities (fastload, multiload, tpump)
- ▶ The NCR Active Warehouse is an important step towards minimized latency in data warehouses

Thank You!

- ▶ Roland Braitto (TU Vienna)
QTool Development

- ▶ Teradata Division – Austria
Cooperation and knowledge exchange
Valuable discussion on various topics (e.g. EAI & DWH)

- ▶ Teradata CoE

Further information on:

- ▶ Testing the Active Warehouse using Teradata Demo 4.x
- ▶ MSMQ 2.0 Features
- ▶ MSMQ 3.0 Features
- ▶ Working with the ADW-sample provided by
the Teradata CoE

- ▶ Teradata Demo 4.0: Win2K, Win NT4
- ▶ Teradata Demo 4.1: Win2K, WinXP (Patch required!)
Download WinXP Patch:
<http://www.teradata.com/solutions/Files4XP.zip>
- ▶ TPump Parameter: **sessions = 1**
- ▶ MSMQ must be configured in **Workgroup mode**
on a standalone machine

- ▶ Win2K Professional, Win2K Servers
- ▶ Win2K security integration (Kerberos)
- ▶ Encryption: 40 bit, 128 bit
- ▶ Active Directory integration
(Workgroup mode is possible but tricky to setup)
- ▶ Windows Cluster (active/active) support
- ▶ 2GB storage limit per machine

- ▶ MSMQ - MQSeries bridge is available
- ▶ Cross platform support:
MQC (Message Queuing Connectors) for Unix, CICS/MVS,
VMS, AS/400

- ▶ WinXP Professional, WinXP Servers

- ▶ New Features
 - Messaging based on HTTP / HTTPS
 - SOAP extensions for reliable messaging (based on HTTP)
 - Network load balancing / web-farm support
 - Multicast messaging
 - Message trigger concept (based on ECA rules)

- ▶ 1TB storage limit per machine
- ▶ Easier administration & deployment

- ▶ ADW – Sample is provided by Teradata CoE
 - Source Feeder for MSMQ / MQSeries (VB 6.0)
 - AXS-module for MSMQ (C++)
 - TPump Scheduler (VB 6.0)

- ▶ Some minor issues:
 - Hard-coded paths in source code
 - No out-of-the-box demo included
 - No sample TPump Job scripts included
 - No AXS-module for MQSeries included (due to licensing)

- ▶ Further information: vincent.hager@austria.ncr.com
